

April 29, 2011

Dear Valued Customer,

As a result of continuous improvement, we have begun to produce Vistamaxx™ propylene-based elastomers absent the dusting agent previously used. Such LDPE dust had been added to the surface of the pellets to help ensure pellet flowability for product storage and transfer.

It has now been determined through extensive tests, under various conditions and climates that Vistamaxx grades no longer need the LDPE dust to facilitate product storage and transfer.

There is no change in the price of Vistamaxx as a result of the elimination of LDPE dust, and no change in product performance is expected. Vistamaxx will continue to be supplied in the same packages (i.e., 25kg bags and 600kg octabins), and with the same package and documentation markings and nomenclature.

The grades of Vistamaxx propylene-based elastomers that are now being packaged without LDPE dust are:

- Vistamaxx VM3000
- Vistamaxx 3020FL
- Vistamaxx 3980
- Vistamaxx 6102
- Vistamaxx 6202

You will begin to receive Vistamaxx without LDPE dust in your orders, as inventory levels of remaining product with the LDPE dust agent are depleted in the normal course of stock management, which occurs on a first-in, first-out (FIFO) basis.

We thank you for your business and look forward to continued growth and success. Please do not hesitate to contact your ExxonMobil Chemical Sales Representative with any questions you may have.

Sincerely,

A handwritten signature in black ink that reads "George Panagopoulos".
